## 7. Edge Computing Computer Module Register Configuration

### I. Register Assignment

The edge computing computer module will, based on the user's module configuration, automatically assign each module a register address based on the modules' functions, types (digital or analog), station number and data consumption. The registers are assigned based on the priority below: Digital→Analog→Station number

Register address assignment:

The address for input initial registers starts from 0x1000;

the address for output initial registers starts from 0x2000;

A single piece of 16-channel digital module will take up 1 WORD/ 2 BYTE while a single piece of 4-channel analog module will take up 4 WORD/ 8 BYTE of data.

**II. Input module initial register (0x1000)**

The edge computing computer module will, based on the user's module configuration, automatically assign each module an input module register based on the modules' functions, types (digital or analog), station number and data consumption.

The registers are assigned based on the priority below: **Digital→Analog→Station number**

The input initial register address for the (digital) input module with the lowest station number: 0x1000.

Example: With 2 digital input modules (station number 1 and 4) and 2 analog input modules (station number 2 and 3), the edge computing computer module will assign the following input module registers:

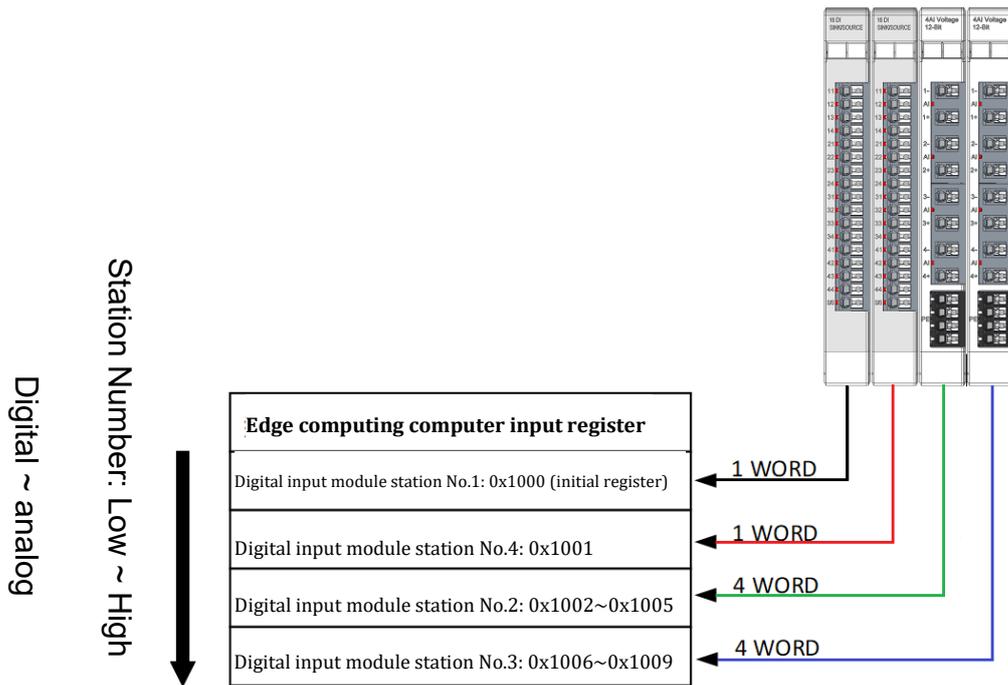

**Digital input module (station No.1):** 0x1000 (output initial register; takes up 1 WORD of data)

**Digital input module (station No.4):** 0x1001 (a range of registers assigned by the edge computing computer module, with the address of 0x1001 (1 higher than the 0x1000 of the station No.1 register address; takes up 1 WORD of data).

**Analog input module (station No.2):** 0x1002~ 0x1005 (a range of registers assigned by the edge computing computer module), with the address of 0x1002 (1 higher than the 0x1001 of the station No.4 register address; takes up 4 WORD of data).

**Analog input module (station No.3):** 0x1006~0x1009 (the edge computing computer module, based on the register assigned to station No.2 and its data consumption, assigns the address of 0x1006 (1 higher than the 0x1005 of the station No.2 register address)).

Edge Computing Computer Module Input Register Assignment:

### III. Output module initial register (0x2000)

The edge computing computer module will, based on the user's module configuration, automatically assign each module an output module register based on the modules' functions, types (digital or analog), station number and data consumption.

The registers are assigned based on the priority below: **Digital→Analog→Station number**

The output initial register address for the (digital) output module with the lowest station number: 0x2000.

Example: With 2 digital output modules (station number 1 and 4) and 2 analog output modules (station number 2 and 3), the edge computing computer module will assign the following output module registers:

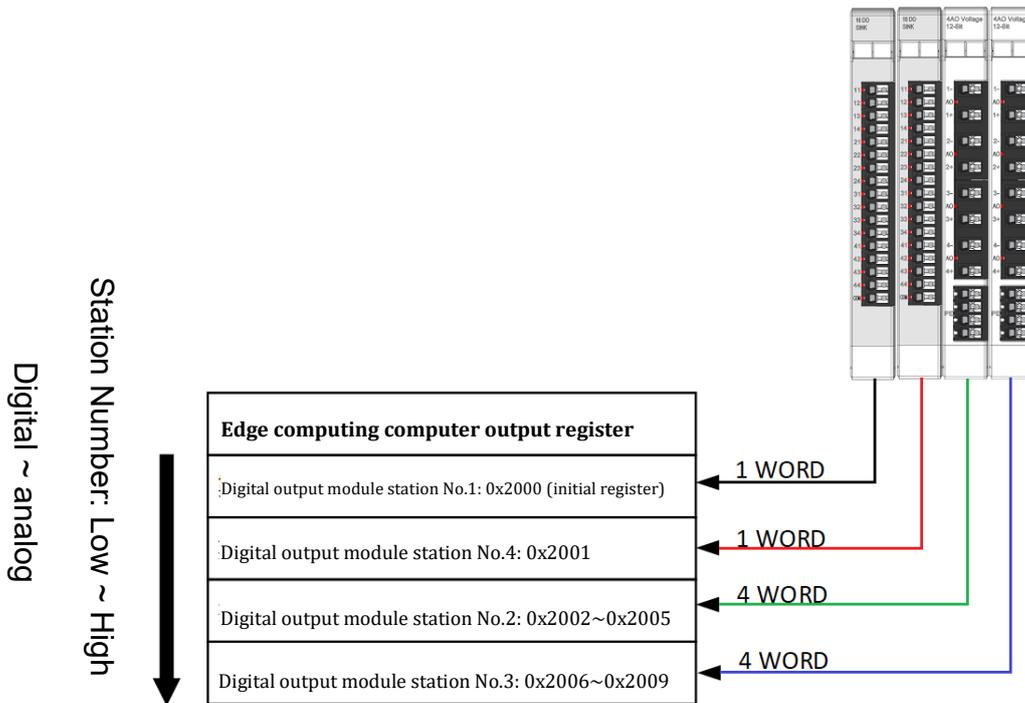

**Digital output module (station No.1):** 0x2000 (output initial register; takes up 1 WORD of data)

**Digital output module (station No.4):** 0x2001 (a range of registers assigned by the edge computing computer module, with the address of 0x2001 (1 higher than the 0x2000 of the station No.1 register address; takes up 1 WORD of data)).

**Analog output module (station No.2):** 0x2002~ 0x2005 (a range of registers assigned by the edge computing computer module, with the address of 0x2002 (1 higher than the 0x2001 of the station No.4 register address; takes up 4 WORD of data)).

**Analog output module (station No.3):** 0x2006~0x2009 (the edge computing computer module, based on the register assigned to station No.4 and its data consumption, assigns the address of 0x2006 (1 higher than the 0x2005 of the station No.2 register address)).
